<b>PART I: THE OUTER LIMITS OF LIFE: THE STRUCTURE AND DYNAMICS OF CELL MEMBRANES</b>	<b>1</b>		
<b>Chapter 1 The Role of Membranes in Cells and Organisms</b>	<b>3</b>		
Membranes establish the outer limits of life	3		
Lipids and proteins have different roles in cell membranes	4		
Membranes provide four basic cellular functions	6		
Membranes are self-renewing structures	7		
Membranes display a unique combination of mechanical and electrical properties	7		
Membranes are linked to diseases and serve as therapeutic targets	8		
<b>Chapter Summary</b>	<b>12</b>		
<b>Further Reading</b>	<b>12</b>		
<b>Chapter 2 The Molecular Organization of Cell Membranes</b>	<b>13</b>		
<b>Membrane Components and Their Organization</b>	<b>13</b>		
The structure of cell membranes is described by the Fluid-mosaic model	13		
Phospholipid bilayers form the structural foundation of cell membranes	15		
The lipid bilayer serves as a scaffold for the attachment and integration of proteins	17		
The width of phospholipid bilayers is universal and matches the size of small proteins	18		
Cell membranes are complex modular structures	19		
The bilayer configuration allows for an adjustable surface area without affecting width	19		
Membrane fusion and fission regulate cell size and surface area	20		
<b>Distribution and Dynamics of Membrane Components</b>	<b>20</b>		
Fluidity is a defining characteristic of cell membranes	20		
Membranes are two-dimensional liquids	22		
Diffusion is an efficient method but not the only means of redistributing membrane components	23		
		Lipids and proteins organize into local domains	24
		Lipid rafts are a paradigm for lipid functionality	26
		<b>The Vesicular Nature of Cell Membranes</b>	<b>27</b>
		Membranes form closed structures called vesicles	27
		Cell shapes can be characterized by membrane curvature	28
		Lipid packing influences membrane curvature	29
		<b>The Quest for a Biological Model of Cell Membranes</b>	<b>32</b>
		The fluid-mosaic model of cell membranes was built on thermodynamic principles	32
		Bringing an old paradigm up to date	36
		<b>Chapter Summary</b>	<b>38</b>
		<b>Further Reading</b>	<b>39</b>
		<b>Chapter 3 The Structure of Membrane Proteins</b>	<b>41</b>
		<b>The Structural Diversity of Membrane Proteins</b>	<b>41</b>
		Membrane proteins provide directionality of function	41
		Membrane proteins come in two flavors: transmembrane and surface-bound	43
		Transmembrane proteins are classified by their secondary structure content and orientation	44
		Monotopic proteins have hydrophobic domains partially embedded in the lipid bilayer	48
		Some surface-bound membrane proteins bind to the membrane with lipid anchors	49
		Peripheral membrane proteins can bind to membranes without a hydrophobic anchor structure	52
		Some peripheral membrane proteins recognize lipids and membrane curvature	53
		<b>Transmembrane Protein Topology</b>	<b>55</b>
		Topology diagrams reveal a protein's interconnectedness	55
		Membrane topology can be inferred from sequence information (and lots of biochemistry)	58
		What is a transmembrane segment anyway?	64

**Rules of Engagement: Proteins in Lipid Bilayers 66**

- Transmembrane proteins have characteristic amphipathic surfaces 66
- Many transmembrane proteins oligomerize into functional complexes and clusters 69
- $\alpha$  Helices form stable bundles within lipid bilayers 71
- Transmembrane domains interact tightly with lipids and co-factors 74
- Synthetic peptides mimic nature 77

**Chapter Summary 80**

**Further Reading 80**

**Chapter 4 The Biological Diversity of Membrane Lipids 83**

**A Biologist’s View of Lipid Diversity 83**

- Why so many lipids? 83
- Lipid classes are rooted in common biosynthetic pathways 86
- What qualifies a lipid as a membrane lipid? 89

**The Molecular Structure of Membrane Lipids 93**

- Biologists think of membrane lipids as phospholipids, glycolipids, and cholesterol 93
- The structure and stereochemistry of lipids with a glycerol core 94
- Head-group composition determines phospholipid nomenclature 97
- The aliphatic chains of membrane lipids are surprisingly diverse 100
- Methyl-branched ether lipids are unique components of archaeal membranes 106
- Sphingolipids complement glycerol-based lipids in cell membranes 109
- Complex systems require redundancy: a role for lipid heterogeneity? 113
- Saccharolipids are part of outer membranes in bacterial cell walls 115
- Sterols and hopanoids are polycyclic triterpenes in eukaryotes and bacteria 120

**The Lipid Distribution in Cells and Organelles 122**

- An organism’s lipid composition is a telltale of its taxonomic status 122
- Organellar and plasma membranes maintain different lipid compositions 123
- The distribution of fatty acyls in membrane lipids is not random 128
- Each leaflet in a lipid bilayer often has a different lipid composition 129

**Special Function Lipids 130**

- Many lipids have roles unrelated to lipid bilayer structure and function 130

- Signaling molecules can be derived from phospholipids 131
- Sterols can act as emulsifiers and signaling molecules 133
- Prenols can act as enzyme co-factors and lipid anchors of proteins 134
- Neutral lipids form waterproof surfaces and store energy 135
- Polyketides play nonconstitutive (toxic) roles in cell membranes 137

**Chapter Summary 139**

**Further Reading 139**

**Chapter 5 The Shape of Membranes and Their Transformations 141**

**Taking Measurements of Membranes 141**

- A good way to study bilayers is to build them from scratch 141
- Model systems demonstrate the self-organizing properties of lipids 143
- Maintaining order in a complex system is a hallmark of life 145
- Lipid monolayers on water surfaces demonstrate the stability of lipid bilayers 148
- Use of lipid crystals enables the structures and dynamics of lipid bilayer and non-bilayer structures to be studied 152
- The thickness of lipid bilayers can be measured by stacking them 157
- Water-free lipid crystals reveal high-resolution structures of phospholipids 158
- Computer simulations reveal disordered conformations of lipid side chains 162

**Of Lipid and Protein Domains 163**

- Fluidity is an organizing principle of membrane structure and function 163
- The molecular properties of membrane lipids can be explored by studying fluidity 164
- Monolayers are well suited to study packing parameters of lipids 169
- Lipid bilayer surfaces compartmentalize into lipid domains 172
- Cholesterol plays a role in lipid domain formation 175
- Proteins, too, are not randomly distributed in cell membranes 175
- The stability of membrane proteins depends on the lateral pressure in bilayers 177

**Stretching and Bending of Cell Membranes 180**

- Membranes can sense the physical state of the environment 180
- Shape transformations are linked to mechanical properties of lipid bilayers 181

Stiffer membranes are more sensitive to pressure changes	185	Small-molecule transporters can be divided into channels and carriers	225
<b>Membrane Fusion and Fission</b>	<b>185</b>	Channels are distinguished by their selectivity and mode of activation	229
No proteins are required for lipid bilayer fusion and fission	185	Several factors influence channel selectivity	230
The stalk model enables investigation of lipid bilayer fusion and fission	186	Channels and pores are regulated by sensors and gates	234
Lipid domains influence shape transformations needed for budding	188	Toxins can block, overstimulate, or function as channels	240
Bilayer fusion or stacking is determined by membrane tension	190	Carrier-mediated substrate transport uses a rocker-switch mechanism	243
<b>Chapter Summary</b>	<b>190</b>	Flux coupling provides active transport of substrates	246
<b>Further Reading</b>	<b>192</b>	Pumps use the energy from chemical reactions and light	250
		Group translocators modify the substrate as it is moved across the membrane	256
<b>PART II: THE LIVING MEMBRANE: THE FUNCTION OF CELL MEMBRANES</b>	<b>193</b>	<b>Translocators of Macromolecules</b>	<b>258</b>
		Cells exchange entire genes and proteins, not just small molecule	258
<b>Chapter 6 Separation: Membranes as Surface and Interface</b>	<b>195</b>	Transport of macromolecules comes in three very different forms	259
<b>Barrier Properties of Membranes</b>	<b>195</b>	The translocon is a universal secretion system for newly synthesized proteins	262
Membranes are first and foremost barriers	195	Bacteria construct dedicated secretion systems	264
Hydrophobicity matters for the basic barrier property	196	Mitochondria and chloroplasts have protein import complexes	268
Diffusion across cell membranes can be described by a few simple rules	198	<b>Vesicle-mediated Transport</b>	<b>270</b>
The curious case of ion impermeability	201	Fusion and fission play a part in membrane transport	270
Bilayers are great electrical insulators	202	Membrane fusion and fission in cells are regulated by membrane proteins	271
The study of osmosis led to the concept of semi-permeability	205	Eukaryotic viruses release their genome through fusion pores	274
Water permeability is linked to membrane fluidity	205	<b>Tunneling Complexes</b>	<b>275</b>
<b>Surface Properties of Membranes</b>	<b>206</b>	Plasmodesmata provide connections between plant cells	275
The surfaces of membranes are 'wet' and charged	206	The nuclear pore complex is a multifaceted transport machinery	277
Lipid head groups contribute to the surface potential of membranes	208	Animal cells connect over a distance using tunneling nanotubes	277
Surface potentials affect the structure and function of transmembrane proteins	209	<b>Chapter Summary</b>	<b>279</b>
Peripheral membrane proteins reversibly bind to lipid bilayer surfaces	212	<b>Further Reading</b>	<b>280</b>
Depositing bilayers on solid support materials reveals the surface properties of membranes	214		
<b>Chapter Summary</b>	<b>218</b>	<b>Chapter 8 Integration: Membranes as Gatekeepers of Information</b>	<b>281</b>
<b>Further Reading</b>	<b>219</b>	<b>Cell Membranes as Sensors and Anchors</b>	<b>281</b>
		Membranes integrate cells into their environment through cell adhesion and signaling	281
<b>Chapter 7 Exchange: Membrane Crossings</b>	<b>221</b>	Cell communication requires information transfer across cell membranes	283
<b>The Many Ways to Cross a Membrane</b>	<b>221</b>		
<b>Small-Molecule Transporters</b>	<b>222</b>		
Protein-mediated transport is specific and incredibly diverse	222		

Cell membranes are involved in sending and receiving chemical signals	286	Membrane enzymes come in all forms and shapes (and reaction mechanisms)	334
Conserved receptor-activation architecture provides a platform for ligand binding diversity	290	<b>Powering Cells: Membranes as Batteries</b>	<b>337</b>
Receptor dimerization and scaffolding are common first steps in signaling	294	Membranes can extract, convert, and store energy	337
Adhesion junctions anchor cells into tissues and organs	298	Electron-transport chains in respiration and photosynthesis are proton pumps	338
Junctions mediate physical forces among intra- and extracellular filaments	304	The respirasome explains how membrane protein complexes form functional units	342
Synapses are junctions that integrate cell-to-cell signaling into adhesion zones	304	Thylakoid membranes compartmentalize light-harvesting megacomplexes	343
Juxtacrine signaling: operates as a 'bind, split, go' process	307	<b>Building Membranes, Building Cells</b>	<b>344</b>
<b>Electrical Signaling in Membranes</b>	<b>308</b>	Modern membranes are self-renewing structures and are not built from scratch	344
Information can be encoded by changes in membrane potentials	308	The first membranes were built differently	345
Action potentials result from dynamic channel gating	314	A membrane can be built in the lab as if it were the first one	346
Electrical signals propagate at extraordinary speeds	315	Internal membranes promote the evolution of larger cells	347
Neuronal synapses mediate signals between excitable cells	317	Membrane heredity maintains membrane structural and functional diversity	349
The use of membrane potentials in nonexcitable cells	319	Spatial organization is important for membrane renewal	350
<b>Chapter Summary</b>	<b>322</b>	Proteins have special signal sequences to find their destination membrane	354
<b>Further Reading</b>	<b>322</b>	Fusion and fission are central to maintaining and building cells	356
<b>Chapter 9 Metabolism: Growing Membranes, Sustaining Cells</b>	<b>325</b>	<b>Chapter Summary</b>	<b>360</b>
<b>Compartmentation of Metabolism</b>	<b>325</b>	<b>Further Reading</b>	<b>360</b>
Membranes are an integral part of cellular metabolism	325	<b>Appendix A: Amino Acids as Building Blocks of Proteins</b>	<b>363</b>
Membranes contribute to the spatial organization of metabolic pathways	326	<b>Appendix B: Detergents and Micelles</b>	<b>367</b>
The transport metabolon: when metabolic pathways span across compartments	328	<b>Appendix C: Strategies for High-Resolution Structure Determination for Membrane Proteins</b>	<b>371</b>
Bacteria also make use of compartmentation	329	<b>Index</b>	<b>375</b>
Membranes host their own metabolic pathways	332
